to Dr. Marisa Roncati

Expert in dental hygiene

After a degree in letters, she graduated as a dental hygienist at Forsyth School in Boston and later she got a degree in Dentistry at the University of Ferrara. Nowadays she is a professor in dental hygiene at the Polytechnic University of March, at the University Master of Prosthesis and Prosthetic Implants at the University of Bologna and at the European Master Degree on Laser Application at the University "La Sapienza" in Rome.

A correct and effective oral hygiene at home, associated with a professional periodical removal of plaque under gums, allows to control or even prevent the most common diseases of the oral cavity: caries and gingival inflammation. The **Digital Brush Baby**, if used regularly, can be a useful instrument to grow up without caries and without any problems of gingival inflammation.

To clean teeth
and gums
since your birth

It is renowned that the babies' oral cavity is sterile but then it acquires the microorganisms of the oral system from the environment. Bacteria are a certain cause of caries. To grow up without caries, you just need to reduce/eliminate bacteria from the baby's oral cavity.

It gently removes bacteria from teeth and gums to prevent infections and caries

The Italian Ministry of Health acknowledged the international indications of W. H. O. Later it issued the "National guidelines for promoting oral hygiene and for preventing oral pathologies during the age of development", which were published in 2008. They can easily be downloaded from the website of the Ministry of Health.

Advice 1

Dental caries still have a high incidence in Italy.

Advice 2

Oral hygiene for children from 0 to 3 years old must be transferred to parents. Before tooth eruption, gums must be cleaned with a damp towel. From the eruption of the first milk tooth (deciduous), teeth must be carefully cleaned with a toothbrush as soon as possible.

In children between 2 and 5 years old, caries are increasing of 15,2%. In Italy the prevalence of caries is 22% at 4 years old and about 44% at 12 years old.

It is never too late to start cleaning your BABY's mucosa. This important information is frequently not spread among mothers-to-be and new mothers.

Digital Brush Saline is effective to remove bacteria from the baby's mouth. It is not traumatic, even if used on the mucosa of a baby, who hasn't got deciduous teeth yet.

The use of the Digital Brush Saline is recommended once a day, after dinner.
